AA265634 to AA269578 represent human bialielic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AA26959 to AA271440 represent amplification primers for the bialielic markers. The bialielic markers of the invention have a variety of uses; they can be used for high density mapping of the human genome, and in complex association studies and happing of the human genome, and in complex association studies and happing of the human genome, and in complex association studies and happing of the human genome, and in complex association studies and persent of the invention can also be useful a quents and methods of the invention can also pharmaceutical agents and diagnostic methods, as well as the effects from pharmaceutical agents acting on a disease as well as other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel biallelic markers used to construct a high density disequilibrium map of the human genome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             treatment.
N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297
and 3367, are not actually given a sequence in the Sequence Listing from the present invention.

                                                                                                                                                                                                                                                                                                                                                                       AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to
                                                                                                                                                                                                                                                                                           Novel biallelic markers used to construct a high density disequilibrium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                     AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of
                                                                                                                                                                                                                                                                                                                                       Novel biallelic markers used to construct a high density disequilibrium map of the human genome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other

The invention relates to a PCR-based method of differentiating between different varieties of rice. In particular, a single giain of polished or cooked rice is used in the method. When rice DNA is subjected to techniques such as RAPD (random amplification of cooked rice is used in the method. When rice DNA is objanophic DNA), different varieties of rice produce different characteristic patterns of variously sized fragments (detected as bands on an electrophoresis gel). The method of the invention uses sets of PCR primers specific for the 5' and 3' ends of fragments designated Si3.

M2CG, M1J, BI, MKAB, JG, BIB, MZF, TB, FG, GiB, BJ and AJ to amplify cree genomic DNA. The amplified fragments are visualised via gell celectrophoresis. The presence of absence of particular amplified fragments in a sample (the banding pattern) enables one variety of rice to be distinguished from another. The method of the invention is replicated from an electrophoresis in represent fragment specific PCR primers used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          13.2%: Score 15.8; DB 22; Length 50;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               õ
                                                                                                                                                                                                                                                                                                         This invention describes a novel nucleic acid molecule (1), useful as a combination of at least two nucleic acids (11) for detecting bacteria. The invention also describes (1) a combination of at least two nucleic acids (11) for detecting to bacteria or phylogenetic groups of bacteria, particularly enterobacteria; (2) a kit containing (1) or the combination of (11); (3) detecting the sample with (1) or the combination of (11); (3) detecting the bacteria (particularly enterobacteria; (1) a sample with (1) or the combination of (11) and precisit of the combination of (11) as primers. The method is and (4) amplifying (4) bacterial but from many different taxonomic of used to detect and identify bacteria, for clinical lagnosis and for detecting contamination of food. (1) can detect bacteria at various detecting contamination of food. (1) can detect bacteria at various contamination of food (1) can detect bacteria at various genera or species). The method exploits the fact that the 235 and 55 FDNA creations, and the intermediate transcribed spacer. contain some sequences that are highly conserved and others that are highly variable.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                   New nucleic acid primers and probes, useful for bacterial detection, in 
cinical diagnosts and detecting food contamination, comprises 23S and 
5S robs sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Rice; variety identification; characterisation; differentiation; and patent and patent stylo frequent; randos amplification of polymorphic DNA; amplification; single grain sample; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ò
                                                                                          This PCR primer is used with EA22 (AAT89778) to amplify a fragment of the EZ repressor protein using the plasmid pCC-EZ as a template. This fragment was ligated into Nocl Banil cleaved pCT8c. Primer EA21 introduced an NcoI site that added a methionine codon followed by an analyse [codon S adjacent to the coding region for the carboxy terminal 101 residues of BPV-I EZ. The plasmids used in this study can be used in the sandyst exeminal coloracy for the delivery of biologically active cases movel method for the delivery of biologically active cases molecules into the cytoplasm and nuclei of eukaryotic cells. The tat protein from immunodeficiency virus (e.g. HIV-1, HIV-2, SIV) is readily taken up into calls when present extracellularly and can be modified to covolently into link to cargo proteins e.g. the EZ repressor protein, producing a fusion link to cargo proteins e.g. the EZ repressor protein, producing a fusion core without the biological activity of the cargo molecule. This is applicable call the the biological activity of the cargo molecule. This is applicable small molecules and macromolecules e.g. proteins, nucleic acids and pusaccharides.
                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                Gaps
                                    Fusion proteins containing truncated HIV tat sequences - useful for
intracellular delivery of viral repressor proteins

The Maying amino acids 40-57 of human immunodeficiency virus tat protein main an uncleic acid cargo moitety.

The Anique amino acids 40-57 of human immunodeficiency virus tat protein and nucleic acid cargo moitety.

Example 13. Columns 93-94: 77pp: English.

Example 13. Columns 93-94: 77pp: English a transport conjugates can be used to deliver cargo completed moitety complishing boving applicane virus 1 mmunodeficiency virus (HIV) tat protein. but not residues 22-36 moitety of the cargo moitety complishing boving applicane virus 1 mmunodeficiency virus (HIV) tat protein. The HIV tat protein is credity taken up into cells and nucleic of cells for the protein is credity taken up into cells and the cell of cells for the protein is credity prophylactic and disposatic applications. The HIV tat protein is credity taken up into cells and the cells in ocleus. The reduced size of the transport polypeptides minimises interference with the coff the absence of the cysteles rich region of the HIV tat protein.

ANY56597-V56610 are primers used in a method for the delivery of biologically active cargo molecules into the cytoplasm and nuclei of coils, for therapeutic, prophylactic or diagnostic purposes. This is accomplished by the presence of a small, basic section of the tat accomplished by the presence of a small, basic section of the tat accomplished by the presence of a small, basic section of the tat cransport protein from husen immunodefriciency virus (HVV) Type I. This is used as it is this protein which is observed to cause human cells in combination with a transport molety usually in the form of a fusion protein. The cargo molety is a human apalinomavities Ex repressor that cretains its biological activity after delivery into a target cell and where the transport molety is one of following HV tat protein fragments (i) as 1.21 and 18-72, (g) as 47-52, (d) as 38-62. The proteins allow delivery of specific peptides into cells at high concentrations due to use of existing transporters. Previous methods of delivery include Combardment and transforming, which only allow a fraction of the cell population to be infected and can additionally damage cells as they
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Delivering biologically active cargo molecules such as polypeptides, nucleic acids into cells by using transport polypeptides which comprise human Immunodeficiency vitus transactivator procein linked to cargo

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                              PCR primers EA11 (AAT84579) and EA22 (AAT84580) were used to amplify byovine papiliomavirus E2 repressor DNA from plasmid pc0-E2.
EA21 introduces an Ncol site that adds a Met codon followed by an Ala codon 5 to the coding region for the C-terminal 101 tersidues of BPV-1 E2. The PCR product was used in the preparation of chemically cross-linked rat-E2 conjugates. Wovel transport proteins comprise a fusion between HV tat protein, preferably region, and a cargo molecule. The transport region of the West work of the cargo molecule to relis in vivo or in vitro.

The invention relates to a method for delivering a biologically active cargo molecule of interest into a cell. The method comprises presenting to the method comprises presenting to the method comprises presenting conjugate consisting of a cargo molecty and a transport molecy linked conjugate consisting of a cargo molecty and a transport molecy having amino acids 49-75 of human immunodeficiency virus (HIV) transactivator (tet) protein and lacking amino acids 27-36 and 77-86 of HIV tat protein.

The method is useful for delivering a molecule of interest such as polypepitides, antigen, monoclonal antibody, single- or double-stranded nucleic acid, a therapeutic, prophylactic and diagnostic molecule to a cell in vitro or in vivo. The method delivers proteins or peptides, including regulatory factors, enzymes, drugs or toxins into the cytoplasm and cell, nucleus. The method is useful for diagnostic, prophylactic or therapeutic intracellular delivery of small and macro molecules. The present sequence is a PCR primer used for generating boxine papillomavirus-16 (BPV-16) E2 protein used in the exemplification of the cytoplasm.

                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Genes and their products differentially expressed in T helpor cells · useful in diagnosis and treatment of immune disorders, e.g. multiple scienosis, asthma, lepromatous leprosy, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A forward primer (AAT38277) and reverse primer (AAT38278) were used to amplify DNA encoding the extracellular domain (but not the signal peptide) of the murine 103 gene product. The 103 gene (AAT38272) is differentially expressed in T helper TH2 cells. The PCR product was used to construct a plasmid encoding a fusion protein contg. the CD5 signal sequence, 103 extracellular domain

Genes which are differentially expressed within and among T helper (TH) cells and TH cell subpopulations, e.g. TH0; TH1 and TH2 subpopulations, can be used diagnostically or as targets for therapeutic intervention. The polypeptides are useful for treating and diagnosing of immune disorders. sepecially I lymphocyte-related disorders. These disorders include chronic inflammatory diseases and disorders (e.g. Crohn's disease, reactive arthritis, Lyme disease, Hashimoto's thyroiditis or farave's disease), or atopic conditions (e.g. asthma and altergy, including allergic rhintis or food allergies). Also included are certain pathogen susceptibilities (e.g. leishmaniasis), and viral (e.g. HIV) or bacterial (e.g. tuberculosis or lepromatous leprosy) infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAA51910-11 were used to amplify the cDNA encoding extracellular domain of the murine 103 gene. The amplified fragment was used to construct an

The invention relates to methods and compositions for treatment and diagnosis of immune disorders, sepecially T lymphocyte related disorders. The methods and compositions of the present invention particles. The methods and compositions of the present invention particles are strained and compositions and/or activity of 103 gene. This gene is alternatively referred as $72. The and Fit-1 and is differentially expressed in Theler ("ymphocyte 2 (THZ) cells. Antibodies specific for 103 gene are useful for the treatment and prevention of immune disorders in humans, preferably THZ related disorders. Such as astribacies. Inhumans, preferably THZ related disorders such as antibodies. Thours, antisense oligonosic of 103 gene such as antibodies. Thours, antisense oligonosic of immune disorders such as crohn's disease, arthritis, insulin dependent diabetes, multiple sciences; thanhumoto's thyrciditis, Grave's disease, graft rejection, contect dermatitis, postiasis, allergic rhinitis, conjunctivitis, graft versus bost disease, glomerular nephritis, sarcoidosis, cosinophilia, system. Tupus erythematosus, scleroderma and helminthic (e.g. tuberculosis and lepromatous leprosa). Primer used to amplify a fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      103 gene: immune disordor: T helper lymphocyte 2 related disorder: TTA2, ST22, TI; Elt.1; therapy: asthama; alletay; 152. IL-4; antivital; immunoglobulin E mediated condition; interleukin-4 mediated condition; crown's disease; arthritis; insulin-dependent diabetes; antihelminthic: multiple sclerois; Hassimoto's thyrolditis; Grave's disease; contact dermattis; psortasis, allergic rhinitis; conjunctivitis; glomerular nephritis; systemic lugus erythematosus; eosinophilis; neuroprotective; ophthalmological; antibacterial; immunosuppressive; sarcoloosis; scloroderms; mutine; PCR primer; sa.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New 103 gane products and immunospecific antibodies, useful for the dagnosis and treatment of T helper lymphocyte 2 (like) related immune disorders e.g. asthma. allergy, immunoglobulin E and interleukin-4 mediated conditions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is that of the forward primer (reverse primer given in AA170134) used in the PCR amplification of a DNA fragment conding the extracellular demain of the murine 201 gene (see AA170157). The primers were designed to create a 5' Kpil site and a 5' Manis it in the amplified fragment to facilitate insertion into plasmid pc05-c04-1961. The PCR product was used in the construction of a fusion comprising the CDS signal sequence, 103 gene product extracellular domain and the human 1961 heavy chain for region. The murine 103 gene is preferentially expressed in the TH2 cell subpopulation, so not of a series of genes identified in the invention as being differentially expressed within and among TH cells and TH cell subpopulations. Such genes can be used diagnostically or as targets for therapeutic invention, especially in the tratment of TH cells ubpopulation. Telated disorders, such as multiple sclerosis, psoriasis and insulin-dependent diabetes; such a multiple sclerosis, psoriasis and insulin-dependent diabetes (contact defratitis, graft rejection, graft versus host disease, contact defratitis, graft rejection, graft versus host disease, sarcoldosis, asthma allergy, allergy, allergy cosinobilia, connuctivitis, grade (e.g. tuberculosis and lepromatous leprosy) infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Detecting 200 gene expression in a sample, useful for treating and diagnosing immune disorders, especially T lymphocyte-related disorders, comprises detecting the presence of a 200 gene product or an RNA encoding the 200 gene product.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence was used to amplify a DNA fragment encoding the extracellular domain of the murine 103 gene, a T helper 2 (TH2) enriched gene. The invention relates to an isolated nucleic acid molecule, which comprises the full length murine 200 gene or full length human 200 gene nucleotide sequence. The nucleic acids are useful for treating or diagnosting immune disorders, especially T helper lymphocyte-related disorders, e.g. inflammatory diseases (e.g. Crohn's disease), multiple sclerosis, Grave's disease, contact dermattis, psoriasis, asthma and allergies, or certain viral (e.g. HIV) or bacterial (e.g. tuberculosis)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New murthe or human 200 genes and their corresponding polypeptides, useful for treating or diagnosing immune disorders, especially Thelper lymphocyte-related disorders, e.g. inflammatory diseases or allergies

Sequence 146, Application US/08687421
Patent No. 6177537
GENERAL INFORMATION:
APPLICANT: Janjic, Nebojsa
APPLICANT: Janjic, Nebojsa
TITLE OF INVENTION: HIGH-AFFINITY LIGANDS OF BASIC
TITLE OF INVENTION: PIBROBLAST GROWTH FACTOR AND
TITLE OF INVENTION: THROMBIN
UNMBER OF SEQUENCES: 445
                                        COMPUTER READABLE FORM:
MEDIUM TYPE: Diskette, 3.5 inch, 1.44 MG storage
COMPUTER: IBM compatible
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  MEDIUM TYPE: Diskette, 3.5 inch, 1.44 MB storage COMPUTER: IBM compatible OPERATING SYSTEM: MS-DOS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   õ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 15, Application US/08463682
Patent No. |6008193
GENERAL INFORMATION:
APPLICANT: Leonard Garfinkol, et al.
TITLE OF INVENTION: Willebrand Factor GPID Binding Domain Polypeptides and
TITLE OF INVENTION: Willebrand Factor GPID Binding Domain Polypeptides and
TITLE OF INVENTION: Wethods of Using Same
NUMBER OF SEQUENCES: 24
CORRESPED ADDRESS:
ADDRESSEE: Cooper f Dunham
STREET: 1185 Avenue of Americas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                          Sequence 6, Application US/09387800
Fatent No. 1620072
GENERAL INFORMATION
TITLE OF INVENTION: WOLE ACTIVATOR FOR ALCOHOL DEHYDROGENASE AND GENE
TITLE OF INVENTION: WOLE ACTIVATOR FOR ALCOHOL DEHYDROGENASE AND GENE
TITLE OF INVENTION: WOWELR: US/09/387,800
CURRENT APPLICATION NUMBER: US/09/387,800
CURRENT FILING DATE: 1999-09-01
EARLIER APPLICATION NUMBER: 1990-09-02
SERVIER FILING DATE: 1998-09-02
NUMBER OF SEQ ID NOS: 7
SOFTWARE: Fatentin Ver: 2.1
SEC ID NO 6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ; OTHER INFORMATION: Description of Artificial Sequence:BS-YQKG2-2

Sequence 145, Application US/OB384708A

PATENT NO. 563986B

GENERAL INFORMATION

APPLICANT: Gold, Larry

APPLICANT: Janjic, Neboja

TITLE OF INVENTION: High-Affinley RNA Ligands of Basic

TITLE OF INVENTION: Fibroblast Growth Factors

NUMBER OF SEQUENCES: 227

CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                COMPUTER READABLE FORM:
